FITTING NEW BRAKE DISCS ??????

Think about letting us align them to your car with the new Pro Cut on-car brake lathe starting from as little as £30 per axle. Please ask for a quote for your car.

WHAT WILL THIS DO FOR MY BRAKES ??????

Many cars, even from new, have minor brake hub distortions. The Pro Cut lathe takes a tiny skim from the surface of the new discs to remove any hub or chassis misalignment that may exist on your car and would cause brake vibration after a few thousand miles. Brakes feel smoother and last longer. NO vibration.

WHAT IS BRAKE HUB RUNOUT ??????

This is misalignment of the hub onto which your brake discs and wheels are mounted, many vehicles are corrected at the factory for runout and subsequent fitting of new discs shows up this problem. Hub runout can also happen if a vehicle suffers even minor crash damage such as hitting a kerb. If you have any brake vibration in your car now you CERTAINLY have brake hub runout.

WHY DOESN'T EVERY GARAGE DO THIS THEN ??????

As a brake specialist we have tools most garages do not including the 2009 model Pro Cut brake lathe. We want EBC Brake customers to be totally satisfied and safe in their EBC Brakes driving experience.

IF I DON'T HAVE THIS DONE WILL I HAVE PROBLEMS ??????

Not all cars have brake hub runout but for the ones that do, this is the only cure. If your car has hub runout (which we can inspect for) this is highly advisable and well worth the money.
